

In the claims

1. (Currently Amended) A client-server computer system comprising:  
a client application server that utilizes data in a particular form and generates a validation request for validation of the data and wherein the request includes the data in an initial form;  
an application server accessible by a plurality of client application servers via a plurality of application software protocols, wherein said application server provides a data validation service on the data received from the client application server in response to [[a]] receiving the validation request from [[a]] the client application server and wherein the data validation service compares the data in the initial form to a reference for the particular form utilized by the client application to determine whether the initial form matches the particular form and returns an indication of valid or invalid based on whether the initial form matches the particular form; and,  
a storage mass coupled to said application server for storing a system of dynamically maintainable validation functions for performing said validation service.
2. (Currently Amended) A client-server computer system according to claim 1, wherein said storage mass comprises an Oracle database.
3. (Original) A client-server computer system according to claim 1, wherein said validation functions are represented by a storage schema in the form of Lightweight Directory Access Protocol.
4. (Currently Amended) A client-server computer system according to claim 2, wherein said Oracle database contains a table-based system of rules organized into at least three hierarchically-organized views.
5. (Original) A client-server computer system according to claim 3, wherein the storage schema represented by Lightweight Directory Access Protocol represents a table-based system of rules organized into at least three hierarchically-organized views.

6. (Currently Amended) A client-server computer system according to claim 2, wherein said ~~Oracle~~ database stores validation functions stored as hierarchically-organized views that are dynamically updateable by an external administrator.
7. (Original) A client-server computer system according to claim 3, wherein said storage schema represented by Lightweight Directory Access Protocol represents validation functions stored as hierarchically-organized views that are dynamically updateable by an external administrator.
8. (Currently Amended) A client-server computer system according to claim 4, wherein said application server and said ~~Oracle~~ database are centrally located to said plurality of client application servers and said validation functions are maintainable by a remote administrator.
9. (Original) A client-server computer system according to claim 5, wherein said application server and said storage schema represented by Lightweight Directory Access Protocol are centrally located to said plurality of client application servers and said validation functions are maintainable by a remote administrator.
10. (Currently Amended) An application server comprising:  
a plurality of client application servers, each client application server utilizing data in a particular form and generating requests for validation of that data wherein the requests include the data in an initial form;  
means for performing validation services in response to validation requests from said plurality of client application servers, said means for performing validation services being coupled to said plurality of client application servers and the means for performing validation services performing a comparison of the data in the initial form to a reference corresponding to the particular form used by the client application servers to determine whether the initial form matches the particular form and returning an indicating of valid or invalid based on whether the initial form matches the reference; and,  
means for storing and dynamically maintaining a hierarchically-organized system

of validation rules coupled to said means for performing validation services wherein the validation rules are implemented by the means for performing validation in order to compare the data in the initial form to the reference.

11. (Currently Amended) An application server according to claim 10, wherein said means for storing validation rules comprises an ~~Oracle~~ database.

12. (Original) An application server according to claim 10, wherein said validation rules are stored in a schema in the form of Lightweight Directory Access Protocol.

13. (Currently Amended) An application server according to claim 11, wherein said ~~Oracle~~ database contains a table-based system of rules organized into at least three hierarchically-organized views.

14. (Original) An application server according to claim 12, wherein said schema in the form of Lightweight Directory Access Protocol represents a table-based system of rules organized into at least three hierarchically-organized views.

15. (Currently Amended) An application server according to claim 11, wherein said ~~Oracle~~ database stores validation functions stored as hierarchically-organized views that are dynamically updateable by an external administrator.

16. (Original) An application server according to claim 12, wherein said storage schema represented by Lightweight Directory Access Protocol represents validation functions stored as hierarchically-organized views that are dynamically updateable by an external administrator.

17. (Currently Amended) An application server according to claim 13, wherein said means for performing validation services and said ~~Oracle~~ database are remotely located to said plurality of client application servers and wherein said validation rules are maintainable by a remote administrator.

18. (Original) An application server according to claim 14, wherein said application server and storage schema in the form of Lightweight Directory Access Protocol are remotely located to said plurality of client application servers and further comprises means for maintaining said validation functions.

19. (Currently Amended) A system for providing an application service, the system comprising:

an application server that receives requests for data validation and that performs data validation by comparing data of the requests that is in an initial form to a reference and returns an indication of valid or invalid based on whether the initial form of the data matches the reference;

a plurality of applications coupled to the application server, the plurality of applications utilizing the data in a particular form corresponding to the reference and sending the data in the initial form to the application server with the request for data validation;

one or more application programming interfaces, the one or more application programming interfaces for coupling said plurality of applications to said application server and for coupling the data validation requests and data via a plurality of computer network protocols; and

at least one dynamically-maintainable data schema coupled to said application server for providing access to data validation functions employed by the application server to compare the initial form of the data to the reference.

20. (Currently Amended) A system according to claim 19, wherein said data schema is at least partially in the form of an ~~Oracle~~ database.

21. (Original) A system according to claim 19, wherein said data schema comprises validation functions in the form of Lightweight Directory Access Protocol.

22. (Original) A system according to claim 20, wherein said data schema contains a

table-based system of rules organized into a plurality of hierarchically-organized views.

23. (Original) A system according to claim 21, wherein said data schema in the form of Lightweight Directory Access Protocol represents a table-based system of rules organized into a plurality of hierarchically-organized views.

24. (Original) A system according to claim 20, wherein said data schema stores validation functions stored as hierarchically-organized views.

25. (Original) A system according to claim 21, wherein said data schema in the form of Lightweight Directory Access Protocol represents validation functions stored as hierarchically-organized views that are dynamically updateable.

26. (Original) A system according to claim 22, wherein said application server and said data schema are remotely located to a plurality of client application servers and said validation rules are maintainable by a remote administrator.

27. (Original) A system according to claim 23, wherein said application server and said schema in the form of Lightweight Directory Access Protocol are remotely located to a plurality of client application servers and said validation rules are maintainable by a remote administrator.

28. (Original) The system of claim 26, wherein said system couples data between the application and said application server in the form of a string.

29. (Original) The system of claim 27, wherein said application server treats data passed to it as a string.

30. (Original) The system of claim 28, wherein the said application server receives data from said application in the form of a hashtable.

31. (Currently Amended) A system for providing data validation service on requests from applications running a plurality of software protocols, the system comprising:

a data network;

an application server, the application server in communication with the data network to receive data within validation requests for validation of the initial form of the data and wherein the application server compares the initial form of the data to a reference and returns an indication of valid or invalid based on whether the initial form matches the reference;

at least one application that utilizes the data in a particular form corresponding to the reference, the application in communication with the application server, the application providing validation requests and data in the initial form to the application server via the data network;

one or more open application programming interfaces, the one or more application programming interfaces capable of handling a plurality of software protocols and in communication with the application server and said applications; and

a data schema in communication with said data network, for storing validation functions, and accessible by said application server, wherein said application server processes the validation requests and returns a response of valid or invalid to the applications according to said validation functions stored in said data schema for comparing the initial form of the data to the reference.

32. (Currently Amended) A system according to claim 31, wherein said data schema comprises ~~an Oracle~~ database.

33. (Original) A system according to claim 31, wherein said validation functions are stored in the format of Lightweight Directory Access Protocol.

34. (Currently Amended) A system according to claim 32, wherein said ~~Oracle~~ database contains a table-based system of rules organized into hierarchically-organized views.

35. (Original) A system according to claim 33, wherein said schema in the form of Lightweight Directory Access Protocol represents a table-based system of rules organized into hierarchically-organized views.

36. (Currently Amended) A system for providing an application service, the system comprising:

means for receiving a service request from a customer, wherein the customer requests a validation service to determine whether data in an initial form is valid or invalid based on whether the initial form matches a reference that corresponds to and couples data to said system in the form of hashtables;

means for sending a validation request instruction to an application server corresponding to data in the initial form to be validated;

means for sending a service request from the application server to a database, the service request based at least in part on the validation request;

means for performing hierarchically-based validation services on the data that is in the initial form by comparing the initial form of the data to the reference;

means for remotely updating said database based on current validation requirements of said system;

means for sending a validation result including the indication of whether the data is valid or invalid based on whether the initial form matched the reference from the application server to said customer based at least in part on the validation request; and

means for providing a response to said system from said customer ~~to said system~~ in response to said validation result.

37. (Currently Amended) A computer-readable medium storing a plurality of instructions adapted to be executed by a processor for providing an application service, the plurality of instructions comprising instructions to:

receive a service request from a customer data device, the customer data device including data that is in an initial form to be validated by determining whether the initial form of the data matches a reference corresponding to a particular form utilized by the customer data device;

generate a service session instruction, the service session instruction based at least in part on the service request;

send the service session instruction to one or more open application programming interfaces, the service session instruction corresponding to one or more data validation requests from said customer data device;

perform one or more validation functions based on stored rules in a database by comparing the initial form of the data to the reference; and

send a validation service response to the customer data device that includes the indication of valid or invalid based on whether the initial form of the data matched the reference, the validation service response based on the service request.

38. (Currently Amended) A medium according to claim 37, wherein said database comprises an Oracle database and further comprises an instruction to load said database into a memory upon startup of said application service.

39. (Original) A medium according to claim 37, wherein said validation functions are stored in the format of Lightweight Directory Access Protocol and further comprise an instruction to load said database into a memory upon startup of said application service.

40. (Currently Amended) A method of providing validation data service with a client-server computer system comprising the steps of:

coupling a data validation request between a client application server and an application server, the data validation request including data in an initial form that is compared to a reference that corresponds to a particular form used by the client application server;

providing data validation service request instructions to a data schema in response to said validation request coupled between said client application server and said application server;

retrieving a plurality of hierarchical dynamically maintained validation rules from a centralized storage mass coupled to said application server, the validation rules for comparing the initial form of the data to the reference;

updating said validation rules;  
~~manipulating validating~~ data in accordance with said validation rules; and  
coupling a response that includes an indication of valid or invalid based on  
whether the initial form of the data matched the reference to said client application  
server.

41. (Currently Amended) A method for providing an application service, the method comprising:

a step for sending a data validation service request from a user, the data validation  
service request including data in an initial form;

a step for generating a validation service instruction, the service instruction based  
at least in part on a validation service request from said user;

a step for sending the service instruction to one or more data storage schemas via  
one or more application programming interfaces, the service instruction corresponding to  
one or more validation requests from the user;

a step for dynamically updating a table of validation rules stored in said one or  
more data schemas based on changes to the application service;

a step for calling up at least one table of validation rules from said one or more  
data storage;

a step for performing validation functions on data in accordance with updated  
validation rules stored in said table and the validation request from said user to compare  
the initial form of the data to a reference corresponding to a particular form used by the  
user; and,

a step for sending service response that includes an indication of valid or invalid  
based on whether the initial form of the data matched the reference to the user requesting  
validation service.
